

Annex — The interface

EKORAILS LIMITED · RC 9490673 · Application to the CBN Regulatory Sandbox

SANDBOX ENVIRONMENT. NO LIVE FUNDS. Every partner, rate and settlement is simulated. Balances are not real. Fictional demonstration data.

What these images are

20 screens, captured from the **working application** — signed in as the role named, reading the seeded database. None is a mockup, a wireframe or a design study.

The environment banner is visible in every frame, and the capture script refuses to save an image in which it is absent. Every business, person, document and account identifier shown is fictional; no real identity document or bank detail appears anywhere in this system.

What each image is offered as evidence of

A screenshot captioned "dashboard" proves nothing. Each caption states what the image is evidence **of**, so a reader can check the claim against the picture rather than take the caption on trust.

If you would rather not rely on our screenshots at all, the accompanying evaluator instructions set out how to run the whole system yourself in about five minutes and verify any of these claims directly.

What these images do not show

- **No partner is real.** Every partner interaction shown is a simulator, labelled as one on the screen. No agreement with any institution has been executed.
- **No corridor is confirmed.** The corridor, its currencies and its limits are the facts this application seeks to establish, and they appear as explicit placeholders.
- **No money has moved.** Every balance is simulated, and the nine release gates that would permit live funds are all unmet.
- **This is not a deployment.** The system has run on a developer machine and in continuous integration. No region has been selected, and no claim of data residency in any jurisdiction is made.

What EKORails is not

EKORAILS LIMITED (RC 9490673), trading as EKORails is not:

- Bank
- Deposit-Taking Institution
- Licensed Payment Provider
- Custodian Of Customer Funds
- Cryptocurrency Exchange
- Consumer Investment Platform
- Admitted Participant In The CBN Regulatory Sandbox

How that is enforced rather than merely asserted:

- Settlement defaults to simulation and live funds require nine process-level release gates, none of which can be set from the user interface.
- The chart of accounts contains no customer stored-value account, so the ledger has nowhere to record holding customer money.
- Funding is recorded as arriving at the partner institution, never at EKORails.
- A claims lint runs in CI over all user-facing text and fails the build on unsupported language.

2. Release gates and controls

Auditor / Regulator · /regulator/controls

Evidence of: Nine gates stand between this build and live money, each requiring named evidence, and none is met. None is settable from any interface: they are process configuration read once at start-up. The risk register below them shows control status honestly — nothing has reached independently reviewed.

● **SANDBOX ENVIRONMENT. NO LIVE FUNDS.** Every partner, rate and settlement below is simulated. Balances are not real. Fictional demonstration data.

Controls

What is in place, what is partial and what is not built

Control status is reported honestly, including where it is inconvenient

A control marked "partial" or "not implemented" is genuinely so. Nothing here is upgraded because an interface for it exists.

RISKS RECORDED
16

BLOCKING A PILOT
7
These must be closed first

CONTROLS NOT FULLY IMPLEMENTED
16
Partial, planned or absent

STATE TRANSITIONS DECLARED
37
Every edge is declared; there is no set-state function

What "settled" means here

"Settled" means the partner reported the payment as made. It does not mean settlement finality, which is a legal property conferred by a settlement system operator and which nothing in this build can produce.

Risk register

REFERENCE	CATEGORY	RISK	INHERENT	CONTROLS	STATUS	RESIDUAL	OWNER	BLOCKS PILOT
R-01	Regulatory	Operating outside the approved sandbox scope	Possible / Severe	Corridor is held as an explicit placeholder; the CORRIDOR_PLACEHOLDER_UNCONFIRMED rule fires on every transaction so none can auto-clear compliance; a missing limit is treated as a block rather than as unlimited.	Implemented Tested	Unlikely / Severe	Founder / Compliance	Yes
R-02	Licensing	Appearing to perform a licensed activity	Possible / Critical	No customer stored-value account in the chart of accounts; funding is recorded at the partner; a claims lint over user-facing text fails the build on prohibited language; a standing regulatory-boundary statement is served from the API.	Implemented Tested	Rare / Critical	Founder / Legal	Yes
R-05	Partner Dependency	Single settlement partner concentration	Possible / Severe	Adapters are provider-neutral and resolved by configuration, so a second partner is a configuration and adapter change rather than a rewrite.	Implemented Untested	Possible / Severe	Founder	Yes
R-08	Data Protection	Exposure of personal data	Possible / Major	Field-level AES-256-GCM encryption for identification and account numbers; hashed network identifiers; a redaction layer on every log and audit write; role-based masking in reports; audited document access with a stated reason for external roles.	Implemented Tested	Unlikely / Major	Engineering / Privacy	Yes
R-12	Cyber	Document-borne malware	Possible / Major	Strict file-type allowlist; magic-byte verification against the declared type; refusal of PDFs containing JavaScript, launch actions or embedded files; content hashing.	Implemented Untested	Possible / Major	Engineering / Security	Yes
R-14	Operational	Backup restoration has never been tested	Possible / Critical	A restoration test procedure is written and a test exists; it has not been run against real infrastructure.	Documented Only	Possible / Critical	Engineering	Yes
R-16	Concentration	Key-person dependency	Almost Certain / Major	The Founder Learning Center, the decision log, the build journal and extensive in-code documentation exist specifically to reduce this.	Implemented Untested	Likely / Major	Founder	Yes
R-03	Settlement	Duplicate settlement	Likely / Major	Deterministic idempotency keys derived from the transaction reference; a duplicate submission returns the original result; an unknown outcome is never auto-retrieved and raises a critical exception; the settlement reconciliation run counts submissions per transaction.	Implemented Tested	Unlikely / Major	Engineering / Treasury	No
R-04	Custody	Inadvertent custody of customer funds	Unlikely / Critical	The account category enumeration is a database CHECK constraint. Adding a custody account requires a visible schema migration, not a configuration change.	Implemented Tested	Rare / Critical	Engineering / Legal	No
R-06	Cyber	Account takeover leading to fraudulent payment	Likely / Major	Mandatory MFA; step-up re-authentication before quote acceptance and settlement release; maker-checker on every payment; a new-beneficiary cooling-off rule; device and network signals feeding the compliance engine; session invalidation on password change.	Implemented Tested	Unlikely / Major	Engineering / Security	No
R-07	Cyber	Malicious insider altering records	Unlikely / Critical	The application database role holds no UPDATE or DELETE privilege on audit, ledger-entry or compliance-decision tables; append-only triggers refuse	Implemented Tested	Rare / Critical	Engineering / Security	No

continued (2 of 2)

				audit trail is hash-chained and verifiable in SQL.				
R-09	Accounting	Ledger and transaction state diverging	Unlikely / Major	State transitions and journal postings occur in one database transaction; the transaction-to-ledger reconciliation checks required journals per state daily; the service refuses to start if the trial balance does not net to zero.	☒ Implemented ☒ Tested	Rare / Major	Engineering / Finance	☐ No
R-10	Fx	Unhedged currency exposure	Possible / Moderate	Conversion and positioning post through an FX clearing account that must return to zero; the currency-position reconciliation reports any residual balance as a break.	☒ Implemented ☒ Tested	Unlikely / Moderate	Treasury	☐ No
R-11	Operational	Alert fatigue in compliance review	Likely / Major	Rules carry an explicit false-positive assessment; the compliance report tracks trigger rates and decision times per rule so drift is visible.	☒ Implemented ☐ Untested	Possible / Major	Compliance	☐ No
R-13	Operational	Single-instance operational limits	Almost Certain / Moderate	Documented; the job table supports a distributed lock but no shared store is deployed.	☐ Documented ☐ Only	Likely / Moderate	Engineering	☐ No
R-15	Reputational	Unsupported claims in external material	Likely / Severe	A claims lint runs in CI over user-facing strings in this repository.	☒ Implemented ☒ Tested	Possible / Severe	Founder	☐ No

Environment and release gates

Mode	SANDBOX
Banner	SANDBOX ENVIRONMENT. NO LIVE FUNDS.
Live funds	● Disabled

GATE	REQUIREMENT	EVIDENCE	MET
EKORAILS_GATE_REGULATORY_APPROVAL	Written regulatory approval to operate the pilot has been received and filed.	Approval letter reference and date, attached to the pilot readiness report.	 Not met
EKORAILS_GATE_LICENCE_VERIFIED	Every licensed activity in the flow is performed by a partner whose licence has been independently verified.	Licence register check per partner, dated within 90 days.	 Not met
EKORAILS_GATE_PARTNER_CONTRACTS	Executed contracts are in place with every partner in the settlement chain.	Signed agreements stating which party bears loss at each stage, and by whom settlement finality is conferred — since EKORails cannot confer it.	 Not met
EKORAILS_GATE_SECURITY_REVIEW	Independent security review and penetration test completed, with all critical and high findings closed.	Test report, remediation evidence, retest confirmation.	 Not met
EKORAILS_GATE_PRIVACY_REVIEW	Privacy impact assessment completed and cross-border transfer basis documented.	Signed PIA and transfer assessment.	 Not met
EKORAILS_GATE_OPERATIONAL_CONTROLS	Operating procedures, four-eyes controls and segregation of duties are live and staffed.	Procedures signed off; named role holders; access review completed.	 Not met
EKORAILS_GATE_DR_TESTED	Backup restoration and disaster recovery have been tested end to end, not merely configured.	Restoration test record showing recovered transaction history verified against a known baseline.	 Not met
EKORAILS_GATE_RECONCILIATION_SIGNOFF	Daily reconciliation has run clean against real partner statements for an agreed observation period.	Reconciliation sign-off sheets for the observation period.	 Not met
EKORAILS_GATE_BOARD_APPROVAL	Internal governance approval to commence live money movement.	Board or equivalent minute.	 Not met

Unresolved facts

The CBN Regulatory Sandbox application was not available to this build. No regulatory or commercial fact has been invented. Values below are placeholders awaiting the filing.

3. Audit trail, filtered to authorisation events

Auditor / Regulator · /regulator/audit?category=authorisation

Evidence of: The hash chain verifies, computed inside the database rather than by the application. Refused actions appear alongside successful ones — a trail containing only successes says nothing about what was attempted.

Export a range

Audit trail

0 events, newest first

The hash chain verifies across 685 events

Each entry stores the hash of its predecessor and a hash over its own contents. Verification recomputes both in SQL, so it does not depend on the application being honest.

Each record stores a hash of its predecessor and a hash of its own contents. The check above recomputes both inside the database, so it does not depend on this application telling the truth.

Authorisation

Search the action, e.g. log

Search

No events match this filter.

A refused action is recorded exactly as carefully as a successful one. An audit trail that only contains successes tells you nothing about what somebody tried to do.

4. Trial balance

Auditor / Regulator · /finance/trial-balance

Evidence of: Debits equal credits in every currency. The check runs in SQL against the tables, and the service refuses to start if it fails.

● **SANDBOX ENVIRONMENT. NO LIVE FUNDS.** Every partner, rate and settlement below is simulated. Balances are not real. Fictional demonstration data.

Trial balance

Debits and credits, by currency

In balance

A cross-currency payment is two conversions, not one movement, so each currency has to balance on its own. A journal that mixes currencies still nets to zero within each of them, or the database refuses it at commit time.

CURRENCY	TOTAL DEBITS	TOTAL CREDITS	DIFFERENCE	RESULT
NGN	6,326,400,625.00	6,326,400,625.00	0.00 NGN	Balanced
USD	4,614,261.10	4,614,261.10	0.00 USD	Balanced

Integrity checks

Journals

120

Entries

368

Trial balance nets to zero

Yes

Unbalanced journals

None

Single-entry journals

None

These checks are run in SQL against the tables themselves, not against anything the application remembers. A bug in the application cannot make them pass.

5. Ledger accounts

Auditor / Regulator · /finance/accounts

Evidence of: THE CUSTODY EVIDENCE. There is no customer stored-value account anywhere in this chart of accounts — not disabled, absent. Customer money appears only as a receivable or as a balance the PARTNER institution holds.

● **SANDBOX ENVIRONMENT. NO LIVE FUNDS.** Every partner, rate and settlement below is simulated. Balances are not real. Fictional demonstration data.

Ledger accounts19 accountsEvery currency

There is no customer stored-value account here, and that is deliberate

EKORails does not hold customer funds, so the chart of accounts gives it nowhere to record holding them. Customer money appears as a receivable owed to a partner or as a balance the partner institution holds — never as an EKORails balance.

Evaluated25 Aug 2026, 12:55

What the engine actually checked

This record is self-contained. The rule text, parameter values and input data shown here are those in force at evaluation time, copied at the moment of the decision. They are not read back from current configuration and are unaffected by any subsequent rule change.

Ruleset snapshot verifiedThe stored ruleset hash matches a hash recomputed from the snapshot on this page.

Triggered (3)

Rule	Severity	What it found	Condition applied	Parameters
CORRIDOR_PLACEHOLDER_UNCONFIRMED	Medium	Corridor PILOT-CORRIDOR-1 holds placeholder values (INSERT_APPROVED_ORIGIN to INSERT_APPROVED_DESTINATION). Awaiting founder decision FD-002.	The corridor record is still carrying INSERT_APPROVED_* placeholder values.	{}
HIGH_RISK_INDUSTRY	Medium	Declared industry "precious_metals_and_stones" is on the higher-risk list.	The customer's declared industry code appears in the configured list.	{"industries":["gambling","virtual_asset_service_provider","precious_metals_and_stones","arms_and_defence"],
SANCTIONS_MATCH	Prohibited	Sanctions screening returned confirmed_match at score 100 against ORION DELTA HOLDINGS LIMITED, ADEBAYO OLUWASEUN OKONKWO.	The screening provider returns a potential or confirmed match against any screened party.	{"confirmedMatchThreshold":95,"potentialMatchThreshold":80}

Rules checked that did not trigger (23)

Screening

A screening match is a proposal, not a conclusion. Names collide, and a person has to decide whether this is the same person. That decision is recorded with its reason.

Rules are immutable once published

Rules are immutable once published. A change creates a new version; historical evaluations keep the rule text and parameters that were actually in force.

Adverse Media

AuthorisationBehaviouralBeneficiary StatusCorridorCurrencyCustomer StatusDeviceDocumentationFraudIndustryJurisdictionLimitsPepRelated PartySanct

Adverse media flag

ADVERSE_MEDIA_FLAG v1

▲Medium

On trigger: Manual Review · Has not triggered in this environment

Risk it addresses	Publicly reported financial crime, fraud or regulatory action involving the customer or beneficiary that no list would capture.
When it fires	Adverse-media screening returns a flag.
Evidence required	The screening result and the analyst's assessment of the underlying reporting.
What the system does	The transaction is held for manual review. It is deliberately not rejected: adverse media is an input to judgement and frequently concerns a different person of the same name.
What a person decides	An analyst assesses relevance, recency and credibility, and records a reasoned disposition.
How it gets it wrong	High. Adverse media matching frequently surfaces unrelated individuals of the same name, or reporting that is stale or unfounded. It is an input to judgement, never a decision.
Policy basis	Ongoing due diligence and reputational risk assessment.
Parameters	{ }
In force since	25 Aug 2026

9. Document expiry monitoring

Compliance Analyst · /compliance/documents?within_days=90

Evidence of: Customer evidence is tracked to its expiry. An expired document raises a rule against the next transaction relying on it rather than silently lapsing.

SANDBOX ENVIRONMENT • NO LIVE FUNDS. Every partner, rate and settlement below is simulated. Balances are not real. Fictional demonstration data.

Expiring documents4 documents

An expired document does not stop the world by itselfIt raises a rule against the next transaction that relies on it. That is deliberate: suspending a customer because a certificate lapsed on a Friday is rarely the right answer, but letting a payment proceed on stale evidence never is.

OPEN EXCEPTIONS

7

None past their service target

PARTNERS NOT ACTIVE

6

SIM-DEST-BANK, SIM-FX-PROVIDER, SIM-IDENTITY, SIM-ORIGIN-BANK, SIM-SCREENING, SIM-SETTLEMENT

Some transactions cannot progress without a person

Unknown outcomes, short funding and partial settlements are deliberately not automated. Each one needs somebody to establish what actually happened before the system moves it on.

Under investigation (1)

Something went wrong that the system will not resolve on its own: the partner did not answer, or settled less than instructed. Automatic retry is disabled here — retrying blindly is how a payment gets made twice. Establish the true position with the partner first.

REFERENCE	CUSTOMER	BENEFICIARY	SEND	EXPECTED RECEIVE	AGE
TXN-202608-100023	Port Harcourt Marine Services Limited	Singapore Marine Supply Pte Limited	11,100,000.00 NGN	6,859.80 USD	3 minutes ago

Returned (1)

The destination bank sent the money back. The original settlement is not reversed — a return is a new event, and erasing the first would hide what happened.

REFERENCE	CUSTOMER	BENEFICIARY	SEND	EXPECTED RECEIVE	AGE

Lifecycle

Pending Business Approval

25 Aug 2026, 12:55 · Amara Okonjo-Bello (Business Initiator)

Submitted by the initiator for dual authorisation.

Pending Compliance

25 Aug 2026, 12:55 · Tunde Aroyewun (Business Approver)

Reviewed against the purchase order and the invoice. Authorised.

Compliance Approved

25 Aug 2026, 12:55 · Adaeze Nwachukwu-Ijeoma (Compliance Analyst)

Reviewed the alerts raised by the engine. The corridor placeholder alert is expected until founder decision FD-002 is resolved. Trade documentation and source-of-funds evidence are present and consistent with the declared business profile. Cleared to proceed.

Quote Issued

25 Aug 2026, 12:55 · Chinedu Eze-Maduka (Treasury Operator)

Quote FXQ-202608-100001 issued at a SIMULATED rate of 0.000618000000.

Quote Accepted

25 Aug 2026, 12:55 · Tunde Aroyewun (Business Approver)

Quote accepted; obligation recognised in journal JRN-202608-100003.

LEDGER JOURNAL JRN-202608-100003

The customer accepted the quote, so two things became true at once. They now owe us 8040000.000000 NGN to fund the payment (that is the debit, an amount receivable). And we now owe the beneficiary 8000000.000000 NGN of value (that is the credit, an amount payable), with the remainder split between our fee, the partner's fee and any levy. Nothing has moved yet; this journal records that a promise was made in both directions.

Awaiting Funding

25 Aug 2026, 12:55 · Chinedu Eze-Maduka (Treasury Operator)

Funding instruction issued for 8040000.000000 NGN. Funds are payable to the origin partner institution, not to EKORails.

Funding Confirmed

25 Aug 2026, 12:55 · Chinedu Eze-Maduka (Treasury Operator)

Funding of 8040000.000000 NGN confirmed at the origin partner (simulated).

LEDGER JOURNAL JRN-202608-100004

The customer's funds arrived at the origin partner institution. The partner's account goes up by 8040000.000000 NGN and the amount the customer owed us goes down by the same. Read the debit carefully: it is the PARTNER's account, not ours. EKORails is not a deposit-taking institution and never holds the customer's money. In this build the arrival is simulated.

Ready For Settlement

25 Aug 2026, 12:55 · Chinedu Eze-Maduka (Treasury Operator)

Obligation converted at 0.000618000000 and liquidity positioned with the settlement partner (simulated).

LEDGER JOURNAL JRN-202608-100005

The obligation changes currency. We stop owing 8000000.000000 NGN and start owing 4944.000000 USD, converted at 0.000618000000. Because a journal must balance within each currency separately, the two halves are joined through the FX clearing account. FX clearing is now short NGN and long USD — that pair is the open currency position, and it stays visible on the finance dashboard until the matching funds are positioned with the settlement partner.

- Settled**
25 Aug 2026, 12:55 · Simulated Settlement Institution
Partner reported settlement of 4944.000000 USD (simulated). This is a partner report of payment, not settlement finality.
- Beneficiary Confirmed**
25 Aug 2026, 12:55 · Simulated Destination Bank
Destination institution confirmed the beneficiary account was credited (simulated).
- Reconciled**
25 Aug 2026, 12:55 · Job
Matched to the ledger and to the partner statement in the daily reconciliation run.
- Completed**
25 Aug 2026, 12:55 · Yewande Alabi-Coker (Finance Analyst)
Reconciled with no open exceptions; partner fees settled.

LEDGER JOURNAL JRN-202608-100007
The settlement partner paid 4944.000000 USD to the beneficiary. Our obligation to deliver value is discharged (the debit) and the partner's account goes down by the same amount (the credit). Note that "settled" here means the partner reported the payment as made. It does not mean settlement finality, which is a legal property conferred by a settlement system operator and which no simulator can produce.

LEDGER JOURNAL JRN-202608-100008
The fee we owed the partner, 12000.000000 NGN, is paid out of the funds held with them. Our liability to the partner goes down (the debit) and their account goes down by the same (the credit). This is why the fee was recorded as payable at the start rather than netted off the rate: the amount owed, and to whom, stays visible until it is paid.

Configuration

15 keys, 9 unresolved

Configuration is immutable

Configuration values are immutable once written. A change is a new version under maker-checker, and it never rewrites a historical result: every engine copies the values it used into its own output record.

Unresolved placeholders (9)

Each of these is a fact the software needs and does not have. Nothing has been invented to fill the gap: the placeholder is carried through to every screen that would otherwise present it as a value.

KEY	PLACEHOLDER
aml_threshold_set	? {"source":"generally_accepted_practice"}
data_residency_region	? INSERT_APPROVED_CLOUD_REGION
max_pilot_participants	? INSERT_MAX_PILOT_PARTICIPANTS
pilot_corridor	? {"origin": "INSERT_APPROVED_ORIGIN", "destination": "INSERT_APPROVED_DESTINATION", "origin_currency": "INSERT_ORIGIN_CURRENCY", "destination_currency": "INSERT_DESTINATION_CURRENCY"}
pilot_duration_days	? INSERT_PILOT_DURATION_DAYS
regulatory_report_forms	? {"note": "No statutory form identifiers are asserted.", "forms": {}}
sandbox_admission_status	? not_confirmed
settlement_mechanism	? SIMULATED_ONLY
transaction_limits	? {"note": "Demonstration limits are configured on the corridor and are marked provisional.", "daily": "INSERT_DAILY_LIMIT", "monthly": "INSERT_MONTHLY_LIMIT", "per_transaction": "INSERT_PER_TXN_LIM"

Confirmed configuration

KEY	VERSION	VALUE	TYPE	WHAT IT GOVERNS	STATUS	IN FORCE SINCE
four_eyes_break_threshold	1	1000.000000	String	Reconciliation break value above which closure requires a second approver.	Active	25 Aug 2026
legal_entity_particulars	1	{ "statute": "Companies and Allied Matters Act 2020", "evidence": "Certificate of Incorporation supplied by the founder on 2026-08-24.", "registry": "Corporate Affairs Commission", "jurisdiction": "Federal Republic of Nigeria", "trading_name": "EKOrails", "previous_name": "ECO INFRASTRUCTURE	Object	Entity particulars taken from the Certificate of	Active	25 Aug 2026

LIMITED", "registration_number": "RC9490673", "verification_status": "documented_not_independently_verified", "certificate_issued_on": "2026-08-23", "tax_identification_number": "2623794513058"}

These are the only corporate facts the product may state. They are DOCUMENTED, not independently verified: nothing in this build has checked them against the Corporate Affairs Commission register, and verification_status says so rather than letting a reader assume otherwise. The registered office is still NOT asserted, because the certificate does not carry one.

periodic_review_months	1	12	Number	How often an approved customer's KYB is re-reviewed. A conservative default; the risk-based cycle should follow the filing.	Active	25 Aug 2026
quote_validity_seconds	1	900	Number	How long an indicative quote stands before it expires. Internal commercial setting.	Active	25 Aug 2026
screening_adapter	1	simulated_screening_v1	String	Which screening adapter is in use. Provider-neutral; changing this swaps vendor.	Active	25 Aug 2026
settlement_adapter	1	simulated_settlement_v1	String	Which settlement adapter is in use. Provider-neutral; changing this swaps vendor.	Active	25 Aug 2026

Feature flags

A flag marked as a release gate cannot be turned on from the application. It reflects process-level environment configuration and named evidence, and the code refuses to read it from anywhere else.

FLAG	WHAT IT CONTROLS	ENABLED	RELEASE GATE	CHANGEABLE AT RUNTIME
ai_document_extraction	AI-assisted extraction of invoice fields. Proposals only; nothing takes effect without human confirmation.	On	—	Yes, under maker-checker
customer_webhooks	Outbound webhooks to customer systems. Off until endpoint verification is built.	Off	—	Yes, under maker-checker
external_screening_provider	Whether a real screening provider may be called. Immutable at runtime.	Off	Gate	No
guided_demo_mode	The Founder Learning Center guided demonstration.	On	—	Yes, under maker-checker
live_money_movement	Master switch for real money movement. Immutable at runtime: it is governed by the process environment and nine release gates, and no user interface can turn it on.	Off	Gate	No
production_settlement_adapters	Whether real partner adapters may be resolved. Immutable at runtime.	Off	Gate	No
sms_notifications	The optional SMS adapter. Off: no SMS transport is configured in this build.	Off	—	Yes, under maker-checker

Corridors

CORRIDOR	FROM	TO	SEND	RECEIVE	PER TRANSACTION	STATUS	CONFIRMED	NOTES
PILOT-CORRIDOR-1	INSERT_APPROVED_ORIGIN	INSERT_APPROVED_DESTINATION	NGN	USD	50,000,000.00	Enabled	Unconfirmed	PROVISIONAL DEMONSTRATION VALUES. The approved corridor, currencies and limits come from the CBN Regulatory Sandbox application, which was not available to this build. Origin and destination jurisdictions are held as INSERT_APPROVED_* placeholders and is_placeholder is true, so every transaction is routed to manual compliance review. See founder decisions FD-002 and FD-003.

Registered adapters

No adapters registered.

Simulation control

Make a partner fail on purpose. ⚠ **These are simulators, not institutions**

This is how failure gets tested rather than hoped about

A directive tells a partner simulator to produce a specific outcome on its next call. Nothing about the transaction is faked: the system genuinely receives that outcome and genuinely has to deal with it, which is the only way to find out whether it does.

Creating a directive is an audited configuration change.

Direct a simulator

Scenario

Success

The ordinary path. Worth running as a control, so you know the other results mean something.

Partner

Any partner

Leave as "any" to affect whichever partner is called next.

Transaction

The next transaction that reaches this partner

Your roles cannot read transactions, so no list is offered. The directive will apply to whichever transaction reaches the partner next.

Operation

Optional: restrict to one operation, e.g. submit_settlement

How many times it applies

1

Direct the simulator

What each scenario is for

Success	The ordinary path. Worth running as a control, so you know the other results mean something.
Delayed funding	The customer's funds take longer to reach the partner than expected. Nothing settles while the transaction waits, and the wait is visible rather than silent.
Partner-side compliance refusal	The partner runs its own screening and declines. Our compliance approval does not override theirs, and the transaction does not proceed.
Insufficient liquidity	The partner cannot fund the payout. The instruction fails rather than partially executing.
Invalid beneficiary	The destination account details are refused by the receiving bank. The failure names the field, so the customer can correct it.
Timeout — no response at all	The most dangerous case. The transaction goes to "outcome unknown" and automatic retry is switched off, because retrying blindly here is how a payment gets made twice.
Duplicate instruction	The same instruction is submitted twice. The idempotency key should mean the second submission changes nothing and instructs no second payment.
Settlement failed	The partner accepted the instruction and then failed to settle. The obligation stands and the funding is still with the partner.
Partial settlement	Less is settled than instructed. The shortfall goes to settlement suspense with an owner — it is never quietly written off.
Return after settlement	The destination bank sends the money back. The original settlement is NOT reversed: a return is a new event, and erasing the first one would hide what happened.
Partner statement disagrees	The partner reports a different figure from our ledger. Reconciliation should open a break rather than adopt their number.

17. Role and permission matrix

```
System Administrator · /admin/roles
```

Evidence of: Nine roles, each with explicit denials rather than merely absent permissions. Separation-of-duties rules are evaluated against the context of an action, so holding two roles does not confer a capability neither role has.

● **SANDBOX ENVIRONMENT. NO LIVE FUNDS.** Every partner, rate and settlement below is simulated. Balances are not real. Fictional demonstration data.

Roles and permissions

9 roles, 63 permissions, 6 separation rules

A "cannot" is a control; an absent permission is an oversight waiting to happen

Each role below carries explicit denials as well as grants. The denials are enforced against the context of the action, so holding two roles at once does not add up to a permission neither role has on its own.

Roles

Permissions

Separation of duties

Business Initiator

business_initiator · Realm: Business · No step-up required

Manages the business profile and initiates transactions on its behalf.

Cannot

- Cannot approve a compliance review of its own organisation.
- Cannot create, edit or delete a ledger entry.
- Cannot override a transaction limit.
- Cannot read any data belonging to another organisation.
- Cannot provide the dual authorisation for a transaction it initiated.

► Can (16 permissions)

Business Approver

business_approver · Realm: Business · Re-authentication required for sensitive actions

Provides the second authorisation on transactions initiated by colleagues.

Cannot

- Cannot approve a transaction it initiated itself.
- Cannot clear a compliance alert.
- Cannot read any data belonging to another organisation.

► Can (10 permissions)

Compliance Analyst

compliance_analyst · Realm: Backoffice · No step-up required

Reviews KYB cases, screening results and transaction alerts.

Cannot

- Cannot approve a high-risk case; that requires a Compliance Manager.
- Cannot approve its own escalation.
- Cannot change a risk rule.
- Cannot route a settlement or accept an FX quote.

► Can (17 permissions)

Compliance Manager

compliance_manager · Realm: Backoffice · Re-authentication required for sensitive actions

Approves high-risk cases, reviews analyst decisions and files regulatory reports.

Cannot

- Cannot review its own analyst decision.
- Cannot post a ledger entry.
- Cannot set a risk threshold outside the range authorised by configuration.

► Can (25 permissions)

Treasury and Settlement Operator

treasury_operator · Realm: Backoffice · Re-authentication required for sensitive actions

Manages funding, FX quotes, settlement routing and liquidity.

Cannot

- Cannot clear a compliance alert without compliance authorisation.
- Cannot approve a KYB case.

- Cannot release a settlement for a transaction whose compliance review is outstanding.
- Cannot post an unrestricted ledger entry; only reconciliation adjustments, and only with finance approval.

► Can (14 permissions)

Finance and Reconciliation Analyst

finance_analyst · Realm: Backoffice · No step-up required

Owns the ledger, daily reconciliation and financial reporting.

Cannot

- Cannot clear a compliance alert.
- Cannot route a settlement.
- Cannot approve the closure of a break it investigated itself.
- Cannot delete or edit a journal; corrections are made by reversal.

► Can (14 permissions)

Auditor or Regulator

auditor_regulator · Realm: External · No step-up required

Read-only oversight across transactions, decisions, ledger, audit and controls.

Cannot

- Cannot write anything, anywhere. Every route is read-only for this role.
- Sees personal data masked unless a specific unmasking authorisation is recorded.
- Cannot download a customer document without an access reason, which is audited.

► Can (12 permissions)

System Administrator

system_administrator · Realm: Platform · Re-authentication required for sensitive actions

Manages users, roles, configuration and integrations.

Cannot

- Cannot edit transaction history.
- Cannot edit or delete a compliance decision.
- Cannot edit or delete a ledger record.
- Cannot edit or delete an audit record. The database role has no privilege to do so.
- Cannot approve its own configuration change.
- Cannot read customer documents or personal data.

► Can (9 permissions)

Super Administrator

super_administrator · Realm: Platform · Re-authentication required for sensitive actions Break glass

Emergency access only. Time-limited, separately approved, fully audited.

Cannot

- Has no standing access. Every session requires an approved, time-limited break-glass grant.
- Cannot edit transaction history, compliance decisions, ledger records or audit records.
- Cannot approve its own break-glass request.

► Can (14 permissions)

Platform
System Administrator

Product map

16 modules

A feature is never reported complete because its interface exists

A feature is never reported as complete because its interface exists. The stage shown for each module is the highest stage it has genuinely reached.

What each stage means

Designed	The behaviour is specified and the data model supports it. No code yet.
Frontend Built	A user can see it. It may not do anything.
Backend Built	The logic exists and works when called directly.
Integrated	Front end and back end are connected and the flow works end to end.
Tested	Automated tests cover the behaviour, including its failure modes.
Security Reviewed	The module has been examined for the threats in the threat model.
Founder Accepted	You have used it and confirmed it does what you need.
Pilot Ready	Every stage above is complete AND its regulatory dependencies are cleared.

1. Organisation onboarding (KYB)

onboarding

Tested

What it does

Collects everything we need to know about a business before it can move money: who it is legally, who owns and controls it, what it does, where its money comes from, and what it expects to transact. Then it runs screening and puts the case in front of a compliance analyst.

Why it exists

You cannot check whether a payment is suspicious if you do not know who is making it. Every other control in the system assumes this one worked.

Who uses it

A Business Initiator fills it in. A Compliance Analyst reviews it. A Compliance Manager approves it where the customer is high risk.

Regulatory significance

Customer due diligence is the foundational AML obligation. A supervisor examining this business will ask to see the file for a specific customer and will expect to find the evidence, the screening result, the analyst's reasoning and the approver's name.

Main operational risk

Approving a business without genuinely identifying its beneficial owners. Layered ownership structures exist precisely to make this hard, and a UBO register that sums to nothing is a register that has been gamed.

What happens if it fails

You end up moving money for someone you cannot identify. In the best case the relationship is unwound and the customer complains. In the worst case you have handled criminal property and the failure is yours, not the customer's.

What is simulated

Simulated

 Identity verification and screening go to simulators. Documents are hashed, type-checked and basic-screened, but no antivirus service and no blob store are connected.

Known limitations

Ownership is captured as declared, not verified against a company register. No corporate registry integration exists.

2. Compliance engine

compliance_engine

Tested

What it does

Runs every rule against every transaction and records the result of each one — including the rules that did not fire. Produces a risk outcome and a recommended action, and opens a case wherever a person must decide.

Why it exists

Consistency and evidence. A human reviewing every transaction from scratch will decide differently on a Friday afternoon than on a Monday morning, and will not be able to explain either decision two years later.

Who uses it

It runs automatically. Compliance Analysts act on what it produces; Compliance Managers configure it and approve the cases it escalates.

Regulatory significance

This is the transaction monitoring system. A supervisor will ask what your rules are, when they last changed, how you tested them, and — for a specific past transaction — why it was allowed.

Main operational risk

Alert fatigue. A rule set that fires on everything trains analysts to clear alerts without reading them, which is worse than having no rule at all because it produces a false record of diligence.

What happens if it fails

Either you miss a genuinely suspicious transaction, or you drown in false positives and stop looking properly at any of them. Both end in the same place.

What is simulated

Simulated

 Sanctions, PEP and adverse-media screening use a clearly labelled FICTIONAL list. The names on it are invented and must never be replaced with real designated persons.

Known limitations

The high-risk jurisdiction list is deliberately EMPTY: naming jurisdictions would assert a regulatory fact the CBN filing has not supplied. Nigerian AML thresholds are unconfirmed (FD-005). No machine-learning scoring — every rule is explicit and readable.

3. Double-entry ledger

ledger

Tested

What it does

Records every financial movement as two or more entries that add up to zero within each currency. Balances are never stored — they are calculated from the entries every time.

Why it exists

It is the only way to know that the money is where you think it is. A system that tracks balances by updating a number has no way to detect when that number is wrong.

Who uses it

The settlement engine writes to it. Finance and Treasury read it. An auditor tests it.

Regulatory significance

Your books are the evidence of what happened to whose money. An examiner or auditor will reconcile them and will not accept "the status field says settled" as an answer.

Main operational risk

A transaction reaching a state with accounting consequences without its journal being posted. The daily transaction-to-ledger reconciliation exists specifically to catch this.

What happens if it fails

You cannot say how much you owe, to whom, or in which currency. Every downstream report is wrong, and you find out during an audit rather than beforehand.

What is simulated

Simulated

 All balances are simulated. Partner accounts are opened with a "test liquidity" injection that exists only to make it obvious the money was invented for the demonstration.

Known limitations

No period-end close, no accounting-system export, and no multi-entity consolidation. Sub-ledger accounts are created on demand rather than from a maintained chart.

4. Settlement orchestration

settlement ○ Tested

What it does	Moves a transaction through its lifecycle: approval, compliance, quotation, funding, conversion, instruction, settlement and completion. Every move is a declared step with a named actor, a reason and an accounting consequence.
Why it exists	Payments fail in specific ways, and each way needs a different response. Without a state machine those responses become ad-hoc decisions made under pressure.
Who uses it	Treasury drives it. Partners report into it. Everyone else watches it.
Regulatory significance	Demonstrating that a payment cannot skip a control is the core of a sandbox evaluation. A state that can be set directly is a control that can be bypassed.
Main operational risk	Duplicate payment. Specifically: sending an instruction, not learning the outcome, and retrying. Every other failure is recoverable; paying twice usually is not.
What happens if it fails	Either money moves that should not have, or it does not move when it should and the customer loses a trade. Both are reportable; only one is recoverable.
What is simulated	⚠ Simulated Every partner is a simulator. Eleven failure scenarios can be injected on demand: timeouts, insufficient liquidity, invalid beneficiary, partial settlement, returns and more.
Known limitations	Settlement FINALITY is out of scope. "Settled" means a partner reported the payment as made; finality is conferred by a settlement system operator and nothing here can produce it.

5. Reconciliation and exceptions

reconciliation ○ Tested

What it does	Compares our records against themselves and against the partners' records every day, and turns every disagreement into a break with an owner, an age and a required resolution.
Why it exists	Two systems that should agree eventually will not. Reconciliation is how you find out within a day instead of within an audit.
Who uses it	Finance owns it. Treasury and Compliance act on what it finds.
Regulatory significance	Daily reconciliation is a standard supervisory expectation for anyone handling client money flows. A reconciliation that always matches is usually a reconciliation that is not really comparing.
Main operational risk	Reconciling against yourself. If the "partner statement" is derived from your own ledger it will always match, and the control is theatre.
What happens if it fails	A duplicate payment, a missing payment or a systematic fee error goes unnoticed until the amounts are large enough to be someone else's problem.
What is simulated	⚠ Simulated Partner statements come from the simulator's own record of what it did — deliberately NOT from our ledger, so the two views really can disagree. A scenario can make the partner genuinely wrong, and the run genuinely catches it.
Known limitations	No file-based statement ingestion (MT940, CAMT.053) and no tolerance rules for expected rounding differences.

6. Access control and audit

access_control ○ Tested

What it does	Decides who can do what, keeps one customer's data away from another, and records every action in a log that cannot be edited.
Why it exists	Most financial-crime losses involve someone with legitimate access. Controls that only stop outsiders stop the minority of attacks.
Who uses it	Everyone, invisibly. Administrators configure it; auditors test it.
Regulatory significance	Segregation of duties and audit trail integrity are examined directly. "The administrator could change it but would not" is not an answer a supervisor accepts.
Main operational risk	Privilege creep. Roles accumulate permissions until someone can both initiate and approve, and nobody notices because nothing broke.
What happens if it fails	A single insider can move money and erase the evidence. That is the difference between a recoverable incident and an unprovable one.
What is simulated	⚠ Simulated None. Access control and the audit trail are real, and their controls are enforced by the database rather than only by the application.
Known limitations	No external identity provider is connected (the design is OIDC-compatible). No hardware security key support beyond TOTP. Break-glass exists but has not been exercised in a drill.

7. Regulatory boundary

regulatory_boundary ○ Tested

What it does	Keeps the product inside what EKORails is actually permitted to do, and keeps the software from claiming otherwise — in its screens, its API, its reports and its ledger.
Why it exists	The fastest way to end a regulatory relationship is to appear to be doing something you are not licensed for. That usually happens by accident, in a demo, in a sentence nobody reviewed.
Who uses it	Everyone. It is enforced in code rather than in a policy document.
Regulatory significance	This is the first thing a supervisor tests: does the product hold itself out as something it is not?
Main operational risk	Language drift. A phrase like "your EKORails balance" or "guaranteed rate" appears in a screen, then in a deck, then in a conversation with a bank.
What happens if it fails	At best, a correction and lost credibility. At worst, an enforcement question about unlicensed activity.
What is simulated	⚠ Simulated Everything that would require a licence is simulated: funding, FX execution, settlement and the beneficiary credit.
Known limitations	The claims lint checks user-facing strings in this repository. It cannot police a slide deck or a conversation.

8. Document management

document_management ○ Integrated

What it does	Takes the documents a business uploads, checks them structurally, encrypts them, records what each one is and when it expires, and tracks which transaction relied on which document.
Why it exists	A compliance decision rests on evidence, and evidence that cannot be produced later is not evidence. This module is what makes the file reconstructable.
Who uses it	A Business Initiator uploads. A Compliance Analyst reads. An auditor asks for the document a specific decision relied on.
Regulatory significance	Record-keeping is a standalone AML obligation, separate from the obligation to do the check in the first place. A supervisor will ask for the document

Main operational risk	Documents that expire silently. A certificate of incorporation from four years ago tells you about a company that may no longer exist in that form.
What happens if it fails	You can show that you made a decision and not what you made it on, which reads to a supervisor exactly like not having made it.
What is simulated	 Simulated Nothing here is simulated, but two things are absent: there is NO antivirus scanning, and there is NO blob store. Documents are metadata-tracked and encrypted; the bytes are held inline rather than in a managed object store.
Known limitations	The structural checks are type, size and magic-byte checks. They are NOT virus scanning and are not described as such anywhere. Expiry raises a rule against the next transaction that relies on the document; it does not suspend the customer.

9. AI-assisted document extraction

ai_extraction 

What it does	Proposes field values read out of an uploaded document — an invoice number, a total, a date — so that a person confirming them types less. It proposes. It never confirms.
Why it exists	Transcribing invoice details by hand is slow and error-prone. Automating the reading while keeping the confirming is the part of the trade-off that is safe to take.
Who uses it	A Business Initiator confirms or corrects each proposed value.
Regulatory significance	An automated system that decided anything about a customer would raise questions about automated decision-making. This one decides nothing, which is why those questions do not arise.
Main operational risk	Somebody describing this as verification. Extraction reads what a document says; it cannot establish that the document is true, and the difference matters enormously.
What happens if it fails	A wrong value reaches a transaction. The confirmation step is what stops that, which is why it cannot be skipped or defaulted.
What is simulated	 Simulated The extractor is a stub. No model is connected, and the proposals it produces are structural rather than read from the document.
Known limitations	No confidence threshold gates anything: a low-confidence proposal and a high-confidence one are both proposals and both need confirming. That is deliberate, because a threshold would create a class of value nobody looked at.

10. Sanctions, PEP and adverse-media screening

screening 

What it does	Sends a name to a screening provider and records what comes back: matches, their scores, the list they came from, and the reference of the listed entry.
Why it exists	Paying a sanctioned party is the one AML failure with no proportionality defence. Screening is the check that stops it, and the record of the check is what proves you did it.
Who uses it	It runs automatically at onboarding and on every transaction. A Compliance Analyst disposes of each match.
Regulatory significance	Sanctions screening is a strict-liability obligation in most regimes. What a supervisor examines is not whether you had matches — everybody does — but what you did about each one.
Main operational risk	Clearing a match without recording what distinguished the two people. "False positive" with no comparison behind it is the single most common failing in an AML file.
What happens if it fails	Either you pay a sanctioned party, or you refuse a legitimate customer because their name resembles one. Both are serious and the second is far more common.
What is simulated	 Simulated The provider is a simulator with a fictional list. No commercial screening data is connected and no provider has been contracted.
Known limitations	No ongoing rescreening: a customer cleared today is not automatically rechecked when a list changes tomorrow. Nothing classifies what an adverse-media result contains, so a special-category result is indistinguishable from an ordinary one.

11. Compliance case management

case_management 

What it does	Turns an engine outcome into a piece of work: a case with a priority, a service target, an owner, notes and a permanent decision.
Why it exists	An alert nobody owns is an alert nobody works. The case is what converts a finding into an accountable action.
Who uses it	Compliance Analysts and Compliance Managers.
Regulatory significance	The case file is what a supervisor asks for. It has to show what was found, who looked at it, what they concluded and why, and whether the right person made the decision.
Main operational risk	Cases closed to clear a queue rather than because they were resolved. A breached service target creates exactly that pressure.
What happens if it fails	Alerts accumulate unworked, or are cleared without reasoning. Both look identical in a metric and completely different in a file.
What is simulated	 Simulated Nothing. Case management operates on real records of simulated transactions.
Known limitations	No case assignment workflow beyond an owner field, no workload balancing, and no escalation that fires on its own when a target is breached — the breach is visible and nobody is told.

12. Beneficiary management

beneficiary 

What it does	Holds who a business pays, approves each one before first use, and sends a beneficiary back for review when its account details change.
Why it exists	The most common fraud in cross-border trade payments is a substituted account, arriving in an email that appears to come from the supplier. Approving the destination separately from the payment is what breaks that.
Who uses it	A Business Initiator adds. A Compliance Analyst approves.
Regulatory significance	Beneficiary screening is part of the transaction-monitoring obligation. The re-review on change is also the control most directly aimed at authorised push-payment fraud.
Main operational risk	Approving a beneficiary on the strength of the same email that supplied the account details.
What happens if it fails	A customer pays an attacker, using a system that recorded the payment as entirely legitimate.
What is simulated	 Simulated Screening of the beneficiary goes to the simulator. Account identifiers are fictional.
Known limitations	No account-name verification against the destination bank, because no destination bank is connected. That check is the one that would catch a substituted account before the money moves.

13. FX quotingfx_quoting ☐ Tested

What it does	Produces a rate with the spread stated separately, the fees itemised, and an expiry. Indicative until the customer accepts it.
Why it exists	A customer needs to know what a payment will cost before committing. Stating the spread separately is what makes that number honest.
Who uses it	A Treasury Operator issues. A Business Approver accepts.
Regulatory significance	Conduct rather than AML. Misrepresenting a rate — or hiding a fee inside one — is a consumer and business-conduct issue and, at scale, a supervisory one.
Main operational risk	Describing a rate as guaranteed or locked when it is neither. The second is subtler: "locked" means a partner has contractually locked it, and no partner here has.
What happens if it fails	The customer is charged more than they understood, or a rate moves between quotation and settlement and somebody absorbs a loss nobody agreed to.
What is simulated	 Simulated Every rate is produced by a simulator. No liquidity provider is connected and no rate here reflects any market.
Known limitations	A simulated quote can never be marked as contractually locked, which a test asserts. There is no rate-of-the-day, no forward pricing and no hedging.

14. Partner integrationpartner_integration ☐ Tested

What it does	Talks to the institutions that actually hold funds, convert currency, settle payments and credit beneficiaries, through provider-neutral adapters with idempotency keys.
Why it exists	Every licensed activity in this product is performed by somebody else. This module is the boundary between what EKORails does and what it coordinates.
Who uses it	A Treasury Operator, indirectly. A System Administrator configures the adapters.
Regulatory significance	The division of activity across this boundary is what determines whether EKORails is performing a licensed activity. Getting it wrong is not a technical problem.
Main operational risk	A retry after a timeout causing a second payment. This is why an unknown outcome disables automatic retry rather than treating it as a failure.
What happens if it fails	Money moves twice, or is reported as moved when it has not, or the record of what was instructed does not survive.
What is simulated	 Simulated EVERY partner is a simulator. No agreement with any institution has been confirmed to this build, and no partner name here is a claim that an institution has agreed to anything.
Known limitations	There is NO callback authentication, because no partner can call in. A signature scheme must be designed before a real partner is connected — this is a named gap in the threat model.

15. Reporting and exportreporting ☐ Tested

What it does	Produces operational, compliance, financial, pilot and regulatory reports in JSON, CSV, XLSX and PDF, recording each export with a content hash and the masking profile that produced it.
Why it exists	A supervisor, a partner and an auditor each need a different view of the same activity, and each needs to be able to tie an export back to what was asked for.
Who uses it	Every role, filtered to the reports their permissions allow.
Regulatory significance	Regulatory returns are an obligation with named forms and a cadence. Both are UNCONFIRMED here (FD-006), so no form identifier has been invented.
Main operational risk	An export carrying more than the recipient is entitled to see. Masking is applied server-side for exactly this reason.
What happens if it fails	Either a return is filed on wrong figures, or personal data leaves the system in a spreadsheet.
What is simulated	 Simulated The data is real records of simulated activity. The regulatory report carries no statutory form identifier because none has been supplied.
Known limitations	No scheduled or automated filing, and no submission route — a report is produced and downloaded by a person. Formula injection is neutralised in CSV, but a spreadsheet remains a spreadsheet once it leaves.

16. Founder Learning Centerlearning_center ☐ Integrated

What it does	Explains the system to the person responsible for it: the product map, a walkthrough of a real payment, the ledger, the rules, the architecture, the state machine, the decisions, the build journal, the risks, a glossary, a demonstration script and short assessments.
Why it exists	A founder who cannot explain their own system cannot defend it, and the conversations that matter — with a supervisor, a partner bank, a reviewer — are exactly the ones where being told about it is not enough.
Who uses it	Anyone. Every role holds learning.read.
Regulatory significance	None directly. Indirectly, significant: a supervisor forms a view of a business partly from how well the people running it understand it.
Main operational risk	That it flatters the build. A learning centre reporting everything as done teaches the one thing a founder must not learn.
What happens if it fails	The founder learns a version of the system that is more finished than the real one, and says so in a room where somebody checks.
What is simulated	 Simulated Nothing. It reports on the real state of the real system.
Known limitations	Assessment results are recorded and never gate anything, deliberately. The guided demonstration is a script a person follows rather than an automated tour, also deliberately — a tour that runs itself demonstrates the tour.

22 states, 37 declared transitions

What "settled" means here

"Settled" means the partner reported the payment as made. It does not mean settlement finality, which is a legal property conferred by a settlement system operator and which nothing in this build can produce.

There is no function that simply sets a state

Every route between two states is declared with the actor allowed to take it, the permission required, the preconditions, the accounting consequence and whether it needs re-authentication. A state cannot be reached by any other means.

Every state

STATE	WHAT IT MEANS	TERMINAL	ROUTES OUT
additional_information_required	Compliance has asked the customer a question and is waiting for the answer.	+ Has outward routes	1
awaiting_funding	Waiting for the customer to send funds to the partner institution. The funds go to the partner, never to EKORails.	+ Has outward routes	3
beneficiary_confirmed	The destination bank confirmed the beneficiary was credited.	+ Has outward routes	2
cancelled	Withdrawn by the customer before funding. Nothing had moved yet.	○ Nothing follows	0
completed	Finished. A transaction cannot be completed while an open break stands against it.	○ Nothing follows	0
compliance_approved	Compliance cleared it. It now needs a rate before the customer can commit.	+ Has outward routes	1
draft	Created but not yet submitted. Nothing has been checked and nothing is owed.	+ Has outward routes	2
expired	A quote or an approval window lapsed before the next step happened.	○ Nothing follows	0
failed	Settlement was attempted and did not succeed. The funding is still with the partner.	+ Has outward routes	1
funding_confirmed	The partner reports holding the customer's funds. Conversion and positioning come next.	+ Has outward routes	1
partner_processing	The partner accepted the instruction and has not yet reported an outcome.	+ Has outward routes	3
pending_business_approval	Waiting for a second person at the customer to authorise it. The person who created it cannot be that person.	+ Has outward routes	2
pending_compliance	With compliance. No transaction reaches a partner without a recorded compliance decision.	+ Has outward routes	4
quote_accepted	The customer accepted the rate. This is the point at which an obligation is recognised in the ledger.	+ Has outward routes	1
quote_issued	An indicative rate has been offered. It is indicative until accepted, and it expires.	+ Has outward routes	2
ready_for_settlement	Currency converted and liquidity positioned. The instruction can be sent.	+ Has outward routes	1
reconciled	Our record and the partner's record agree, with no unexplained difference.	+ Has outward routes	1
rejected	Refused — by the customer's own approver, by compliance or by the partner. No value moved.	○ Nothing follows	0
returned	The destination bank sent the money back. The original settlement is NOT reversed: a return is a new event, and erasing the first would hide what happened.	+ Has outward routes	1
settled	The partner reported the payment as made. This is not settlement finality, which is a legal property conferred by a settlement system operator and which nothing in this build can produce.	+ Has outward routes	3
submitted_to_partner	The instruction has been sent. The idempotency key means sending it again cannot cause a second payment.	+ Has outward routes	4
under_investigation	Something happened that the system will not resolve on its own — no partner response, or less settled than instructed. Automatic action is deliberately disabled here until a person establishes the true position.	+ Has outward routes	4

Routes out of additional_information_required

Compliance has asked the customer a question and is waiting for the answer.

EVENT	LEADS TO	WHAT HAPPENS	WHO MAY	PERMISSION REQUIRED	RE-AUTHENTICATION	LEDGER EFFECT	NOTIFIES	ONLY IF
information_supplied	pending_compliance	The customer supplies what compliance asked for, and the case returns to the queue.	User	txn.initiate	—	none	Compliance Analyst	at least one new document or message has been added

Decision log

10 decisions, 9 still open

An open decision means the software is running on a placeholder

A decision marked "awaiting_approval" is genuinely unresolved. The software runs with a placeholder in its place and says so wherever the placeholder is visible.

FD-002 — Which corridor and currency pair does the pilot run?

Awaiting Approval

Blocks: Corridor configuration, FX pair, limits, every compliance evaluation.

The issue

The controlling source for the corridor is the CBN Regulatory Sandbox application, which was not available. The corridor is seeded with INSERT_APPROVED_* placeholders and the demonstration data is denominated in NGN and USD purely so the engine can be exercised.

Options considered

{ "option": "Choose the destination by settled partner availability", "consequence": "Slower to announce, but the corridor is real on day one." }

{ "option": "Choose the destination by market size", "consequence": "Attractive commercially, but a corridor with no partner is not a corridor." }

{ "option": "Run two corridors from the start", "consequence": "Doubles the compliance, partner and reconciliation surface during a pilot." }

Recommended

One corridor. Nigeria as origin, with the destination chosen by which licensed settlement partner is contractually available — not by which market is largest.

Main risk

Announcing a corridor before a partner is contracted. Partner availability, not demand, is the binding constraint in cross-border settlement.

Regulatory impact

HIGH. The corridor defines the scope of the sandbox permission. Operating outside it is operating without permission.

Cost impact

Each additional corridor multiplies partner, compliance and reconciliation work.

Reversibility

Costly To Reverse

Record your decision

FD-003 — What transaction and pilot limits apply?

Awaiting Approval

Blocks: The limit and velocity rules; the pilot report's breach measures.

The issue

Per-transaction, daily, monthly and pilot-aggregate limits, plus the participant cap, come from the filing. Provisional demonstration limits are configured and marked as such.

Options considered

{ "option": "Adopt the filing's limits verbatim", "consequence": "No divergence between what was approved and what the system enforces." }

{ "option": "Set internal limits below the filing's", "consequence": "More conservative; a customer hitting the internal limit may not understand why." }

{ "option": "Set internal limits above the filing's", "consequence": "Unacceptable — a breach of the sandbox conditions." }

Recommended

Adopt the filing's limits verbatim, and never set an internal limit above them. Below is a commercial choice; above is a breach.

Main risk

A limit breach is a reportable event, not an internal exception. Until the filing supplies the limits, the LIMIT_NOT_CONFIGURED rule holds every transaction for manual review, which is the intended behaviour rather than a defect.

Regulatory impact

HIGH. Exceeding an agreed cap is the clearest possible breach of pilot conditions.

Cost impact

Lower limits reduce revenue per customer during the pilot.

Reversibility

Easily Reversible

Record your decision

FD-004 — What is the settlement mechanism and who are the partners?

Awaiting Approval

Blocks: Partner adapters, custody posture, the ledger's partner account structure.

The issue

Everything in this build settles through simulators. The real mechanism — correspondent banking, a licensed PSP, or something else — is not asserted anywhere.

Options considered

{ "option": "Correspondent-bank settlement through a licensed partner", "consequence": "Well understood by regulators and banks; slower and more expensive." }

{ "option": "A licensed payment institution as settlement agent", "consequence": "Potentially faster; the partner's own permissions become a dependency." }

{ "option": "Apply for EKORails' own licence", "consequence": "Removes the dependency; adds years and substantial capital." }

Recommended

Correspondent-bank settlement through a licensed partner, with EKORails orchestrating only. This keeps EKORails outside every licensed activity for the pilot.

Main risk

Partner concentration. A single settlement partner is a single point of failure for the entire product, and correspondent relationships are withdrawn with little notice.

Regulatory impact

HIGH. This determines whether EKORails is performing a licensed activity. Get it wrong and the question becomes an enforcement one.

Cost impact

Correspondent settlement carries higher per-transaction cost and requires pre-funding.

Reversibility

Effectively Irreversible

Record your decision

FD-005 — Which AML/CFT thresholds and lists apply?

Awaiting Approval

Blocks: HIGH_RISK_JURISDICTION rule parameters; reporting thresholds.

The issue

Rules implement generally accepted controls, but Nigerian reporting thresholds and the applicable high-risk jurisdiction list are unconfirmed. The jurisdiction list ships EMPTY rather than invented.

Options considered

{ "option": "Adopt the CBN AML/CFT Regulations thresholds once the filing cites them", "consequence": "Correct, but the rule cannot fire until then." }

{ "option": "Use an international default list", "consequence": "Plausible but wrong — it would assert a regulatory fact nobody has given us." }

{ "option": "Set no jurisdiction rule at all", "consequence": "Removes a control rather than deferring it." }

Recommended

Adopt the thresholds and lists the filing cites. Until then the rule exists, is visible, and reports honestly that it cannot fire.

Main risk

An out-of-date list produces false NEGATIVES, which are invisible. The list must be a versioned rule parameter with a stated review cadence, not a code constant.

Regulatory impact

HIGH. Screening against the wrong list is close to not screening.

Cost impact A missed return is a supervisory failure in its own right, regardless of the underlying data.
 Reversibility Easily Reversible

Record your decision

FD-006 — What regulatory returns must be filed, in what form, and how often?

☐ Awaiting Approval

☒ **Blocks: Report headers and the regulatory export route.**

The issue The report shapes are built and exportable in CSV, XLSX and PDF. No statutory form identifier is asserted, because inventing one would be inventing a regulatory fact.

Options considered

- { "option": "Build to the filing's specified returns once supplied", "consequence": "Correct; a short mapping exercise per return." }
- { "option": "Guess the likely forms now", "consequence": "A plausible-looking form identifier on a submitted return is worse than none." }

Recommended Build to the filing's returns. Do not invent form identifiers.

Main risk A missed return is a supervisory failure in its own right, regardless of the underlying data.

Regulatory impact MEDIUM to HIGH depending on the cadence required.

Cost impact Low — the data already exists; only the presentation layer changes.

Reversibility Easily Reversible

Record your decision

FD-007 — How long does the pilot run and what counts as success?

☐ Awaiting Approval

☒ **Blocks: Pilot report targets and the readiness assessment.**

The issue The pilot report computes participants, volumes, completion rate, cost, processing time, exceptions, complaints and incidents. No target thresholds are asserted.

Options considered

- { "option": "Adopt the filing's duration and targets verbatim", "consequence": "What you are measured against is what you agreed." }
- { "option": "Set internal stretch targets above the filing's", "consequence": "Motivating internally; risks appearing to have failed against your own numbers." }

Recommended Adopt the filing's duration and targets verbatim for external reporting. Keep any internal stretch targets internal.

Main risk Reporting against targets you invented, and appearing to miss them, damages credibility more than the underlying performance would.

Regulatory impact MEDIUM. Success measures determine whether the pilot progresses.

Cost impact A longer pilot costs more to run but produces more evidence.

Reversibility Easily Reversible

Record your decision

FD-008 — Where is the system deployed, and what data residency is claimed?

☐ Awaiting Approval

☒ **Blocks: Infrastructure deployment, the privacy impact assessment, customer contracts.**

The issue The deployment region is a placeholder. The system makes NO residency claim. In particular it does not claim African residency on the basis of African ownership.

Options considered

- { "option": "Complete a residency assessment, then choose a region", "consequence": "Slower; defensible." }
- { "option": "Choose an African region and market it as African residency", "consequence": "Marketable, but a claim you cannot support if backups or support access sit elsewhere." }
- { "option": "Choose the cheapest region", "consequence": "May place data outside what the regulator or customers will accept." }

Recommended Complete a data residency and cross-border transfer assessment first. Choose the region from that assessment, and describe residency only in terms of where data actually sits.

Main risk Residency is about where data physically is and whose law reaches it — including backups, logs and support access. A claim that ignores any of those is false.

Regulatory impact HIGH. Data localisation requirements vary and are enforced.

Cost impact Regional pricing varies; some regions lack managed services.

Reversibility Costly To Reverse

Record your decision

FD-009 — What may be said publicly about sandbox status?

☐ Awaiting Approval

☒ **Blocks: All external-facing copy, the pitch deck, the website.**

The issue Admission has not been confirmed to this build. The configuration defaults to not_confirmed and nothing in the product implies otherwise.

Options considered

- { "option": "Say nothing until an admission letter exists", "consequence": "Less impressive in a pitch; entirely safe." }
- { "option": "Say \"engaged with the CBN sandbox process\"", "consequence": "Ambiguous, and ambiguity is read generously by listeners and harshly by regulators." }
- { "option": "Assert admission to the sandbox in external copy", "consequence": "Unacceptable unless and until an admission letter exists." }

Recommended Say nothing about sandbox status until an admission letter exists.

Main risk Overstating regulatory status is one of the fastest ways to lose both a regulator's and a bank partner's confidence, and it is very hard to recover.

Regulatory impact HIGH. Misrepresenting regulatory status is itself a serious matter.

Cost impact None.

Reversibility Easily Reversible

Record your decision

FD-010 — Framework choice: minimal dependencies versus a conventional stack

☐ Awaiting Approval

☒ **Blocks: Nothing. Recorded because a technical due-diligence reviewer will ask why.**

The issue The brief recommends Next.js and NestJS. This build uses TypeScript on Node with one runtime dependency (the PostgreSQL driver), a hand-written router, and a no-build web client. Spreadsheet, PDF and cryptographic functions are implemented directly.

Options considered

- { "option": "Keep the minimal stack", "consequence": "Very small attack surface and no dependency advisories to triage; less familiar to new hires;" }

E

EKORails

Super Administrator

What can I do?

Sign out

more code owned in-house."}

- {"option":"Migrate to Next.js and NestJS","consequence":"Conventional and hireable; adds roughly a thousand transitive dependencies to a system that moves money."}
- {"option":"Hybrid: NestJS API, minimal front end","consequence":"Splits the difference and the drawbacks."}

Recommended

Keep the minimal stack through the pilot, then reassess. The security and supply-chain argument is strongest exactly when the system is under regulatory scrutiny and the team is small.

Main risk

Hiring and onboarding are harder, and hand-written infrastructure carries bugs a mature framework would not. This is a genuine trade, not a free win.

Regulatory impact

LOW directly, but dependency scanning findings are a standard security-review question.

Cost impact

Lower running cost; higher cost to onboard an engineer unfamiliar with the codebase.

Reversibility

Costly To Reverse
